Actively Rhizomatous Tall Fescue

Tall fescue is almost legendary for its deep root system that can go down as deep as three or four feet. Up until now tall fescue has been considered a bunch-type grass that could not spread laterally to fill in damaged areas. But now all of that has changed and now through intense breeding and selection we can offer a new mix of tall fescue that can repair itself and fills in when a hole develops. Survivalist is a proprietary mixture of actively rhizomatous tall fescue cultivars mixed with a Texas bluegrass hybrid. What has emerged is a very drought tolerant, wear tolerant turf that not only has an extremely deep root system to garner deeper soil moisture but also has the ability to form new plants from rhizomes that can repair damage caused to the plant.

Features:

- Good rich, green color
- Great drought tolerance
- Medium texture
- Unsurpassed heat tolerance
- Great wear tolerance
- Active rhizome activity to help repair damage caused by drought or traffic
- Tolerance to varied soil pH
- Improved shade tolerance compared to Kentucky bluegrass
- Deep rooting (3-4 feet!)

Survivalist Tall Fescue

47%	Grande II	Actively rhizomatous Tall Fescue
47%	SR8650	Actively rhizomatous Tall Fescue
6%	Spitfire	Texas hybrid Kentucky bluegrass
